ALL SHEBA LIMITED

One app all services

ALL SHEBA HRMS

Human Resource Management System — Quick Guide

What is it?

One secure web application where All Sheba Limited records daily attendance (with late reasons), manages employees, leave and monthly payroll, and prints or exports any report as PDF, Excel or CSV. It works in any browser on computer or mobile — nothing to install.

Item	Details
Website	https://allsheba-hrms.vercel.app
Admin Panel	Full control: employees, attendance, leave, payroll, reports, users, settings
Entry Panel	Simple daily work: attendance entry, today's overview, leave applications
Login	Username + password given by the administrator (first login asks for a new password)
Office hours	Default 10:00 AM – 7:00 PM, Asia/Dhaka time (changeable in Settings)

1 How to use the system

Who uses what

Role	Opens	Can do
Administrator	/admin	Everything: setup, employees, corrections, leave approval, payroll, reports, users, settings, audit logs
Entry operator	/entry	Record attendance, see today's list, search history, request corrections, submit leave applications. Cannot see salary, payroll or personal data.

Daily attendance (Entry Panel > Quick Attendance)

1. Date is today automatically. Search the employee by name or Employee ID.
2. Morning: press "Now" next to Actual In, then Save. Late minutes are calculated automatically.
3. If late, choose a Late Reason (Traffic Jam, Health Issue, etc.) — it is required.
4. Evening: choose the same employee again, press "Now" next to Actual Out, then Update.
5. Mistake after saving? Open Entry History > "Request correction". The admin approves it.

First-time setup (Admin)

1. Company Settings — name, address, phone, weekly holiday, attendance and payroll rules.
2. Departments — add departments and designations.
3. Holidays & Shifts — confirm office hours and grace period; add public holidays.
4. Employee Management — add each employee (Employee ID is generated automatically). Add salary to include them in payroll.

Monthly routine (Admin)

1. Approve or reject leave in Leave Management, and correction requests in Corrections.
2. Attendance Management > "Close a date range" for the month. This marks Absent / Leave / Holiday / Weekly Off for days without an entry.
3. Payroll Management > choose the month > Generate. Review, add bonus or deductions, then Finalize (locked forever).
4. Print payslips and reports from Print & PDF Center — Print, PDF, Excel or CSV.

How it works — key rules

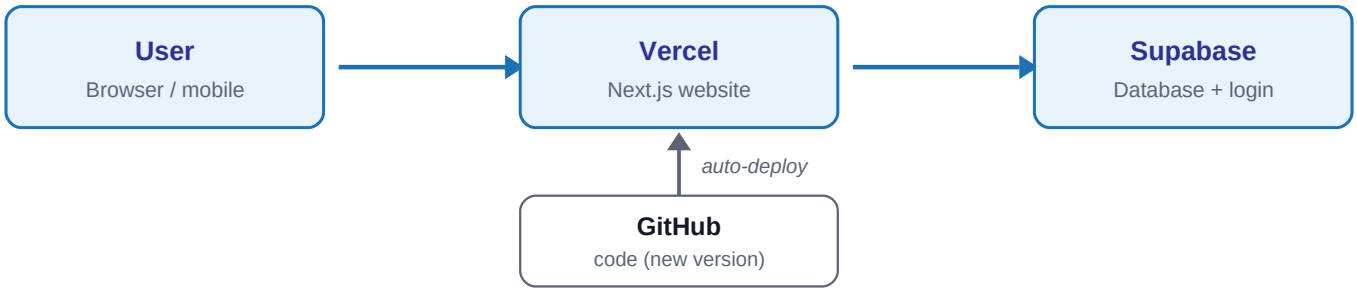

Topic	Rule
Late	Arrival after scheduled in-time + grace period. Late minutes and reason are saved for every late day.
Absent	Never assumed. A day becomes Absent only when the admin (or the nightly auto-close) closes attendance.
Shifts	"General Shift" (10:00–7:00) tracks late and early leave. "Default shift" (no shift set) = Flexible: no schedule, in/out time optional.
Weekly holiday	Company default (Friday) or a custom weekly holiday per employee. Used for attendance, leave days and payroll.
Leave	Weekly holidays and public holidays are not counted. Paid leave is checked against the remaining balance.
Payroll	Basic + allowances + bonus/overtime - deductions. Automatic deductions are OFF until enabled in Settings. Finalized payroll cannot be changed.
Security	Each role sees only what it is allowed to. Every change, login and export is saved in the Audit Log.

2 What the app is built with

Part	Technology	Why
Language	TypeScript (JavaScript with types)	Safer code, fewer bugs
Web framework	Next.js 16 + React 19	Fast pages; the server checks every action
Design	Tailwind CSS + shadcn/ui	Clean, consistent, mobile-friendly screens
Database	Supabase (PostgreSQL)	Stores all data; rules and calculations run inside the database
Login & security	Supabase Auth + Row Level Security	Passwords handled securely; each role can only read allowed data
File storage	Supabase Storage	Logo, employee photos and private HR documents
Reports	jsPDF, ExcelJS, Recharts	PDF, Excel and CSV export; dashboard charts
Code storage	GitHub (private repository)	Keeps every version of the code safely

Part	Technology	Why
Hosting	Vercel	Runs the website online; updates automatically from GitHub
Testing	Vitest + PGlite	Automatic checks of calculations, security and payroll

How the pieces connect

When the code changes, it is pushed to GitHub. Vercel builds and publishes the new version within 2–3 minutes. Database changes are added as numbered SQL files in supabase/migrations and applied once to Supabase.

Keep it safe

Never share passwords, the Supabase secret key or the database password in chat or email. Change the first-login passwords. Only administrators should create users. Detailed technical documents are in the docs folder of the GitHub repository.
